

Vectors & Matrices

- Vectors & Matrices store sets of values, all of which have the same type.
- *row vector*
- *column vector*
- *scalar*
- *matrix*
- *elements*

Creating row vectors

- $v = [1,2,3,4]$
- $v = [1 \quad 2, 3 \quad 4]$
- Colon operator (*iterator*): create equally spaced numbers
 - **from : step : to**
 - $v = 2:1:6$
 - $v = 2:6$
 - $v = 1:2:9$
 - $1:2:6$
 - $6:3$
 - $9:-2:1$
- $\text{linspace}(\text{from}, \text{to}, n)$
 - $\text{linspace}(2,6,5)$
 - $\text{linspace}(6,18,5)$
 - $\text{linspace}(18,6,5)$

Concatenating vectors

- $a = [1\ 2]$
- $b = [3\ 4\ 5]$
- $b = [[\ 3\ 4\]\ 5\]$
- $c = [a\ b]$
- $c = [a\ b\ 1\ 2\ 3]$

Indexing (Accessing) vectors

- variable (index)
- $v=10:15$
- $v(3)$ "*v sub 3*"
- index itself can be a vector
 - $v([1\ 2\ 3])$
- the indexed entries can be modified:
 - $v(2)=30$
- Matlab automatically extends vector if indexed element does not exist.
 - $v(10)=99$
 - Avoid automatic extension when you care about speed.

Exercise

- What is the value of `a` after the following statements are executed?
 - `a=2:2:8`
 - `a(4)=50`
 - `a(6)=11`
 - `a=a(3:6)`
 - `a=[a linspace(4,12,3)]`

Creating column vectors

- $c = [1; 2; 3; 4]$
- Row vectors can be transposed using $'$
- $r = 1:3$
- $c = r'$
- Exercise: Does the following result in a row or column vector?
– $1:3'$

Creating matrix variables

- $m = [4 \quad , \quad 3 \ 1; \quad 2, \ 5 \ 6]$
- $m = [4 \ 3 \ 1$
 $\quad 2 \ 5 \ 6]$
- There must always be the same number of elements in each row.
- $m = [2:4; 3:6]$

Linear Indexing

- Matlab stores and indexes matrices column-by-column.
- We can index a matrix as if it is a vector.

- $m = \begin{bmatrix} 4 & 3 & 1 \\ 6 & 5 & 7 \end{bmatrix}$

4	3	1
6	5	7

- $m(1)$
- $m(2)$
- $m(\text{end}-1:\text{end})$

(Row, Column) Indexing Matrices

2	3	4
5	6	7

- $m = \begin{bmatrix} 2 & 3 & 4 \\ 5 & 6 & 7 \end{bmatrix}$
- $m(2,3)$
- $m(1:2,2:3)$
- $m([2 \ 2], [3 \ 1 \ 3])$
- $m(1,:)$
- $m(:,2)$
- $m(1,2:end)$

- What about $m([2, 3])$?

Modifying matrix elements

- $m = \begin{bmatrix} 2 & 3 & 4 \\ 5 & 6 & 7 \end{bmatrix}$

2	3	4
5	6	7

- $m(1,1) = 9$
- $m(1,1:2) = 13$
- $m(1,[2 \ 1]) = [8 \ 11]$
- $m(1,:) = 9$
- $m(1,:) = [9 \ 9]$
- $m(5,:) = 1:3$

Generator Functions

- rand
- rand(R)
- rand(R, C)
- Others: zeros(), ones(), inf(), nan(), true(), false(), randi()
- randi(**Max**, R, C)
- magic(R)

Matrix Dimensions

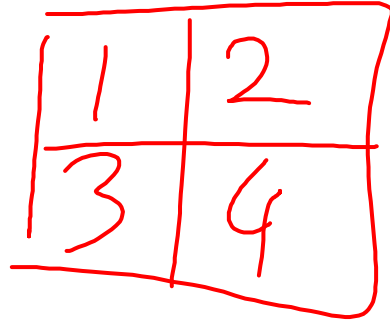

- `size`
- `numel`
- `length`
- `m=rand(2,3)`
- `size(m)`
- `[R, C] = size(m)`
- `numel(m)`
- Exercise:
 - Write function that takes a matrix `m` as input, and returns a matrix of zeros with the same size as `m`.

Changing Dimensions

- reshape
 - `m=randi(100,3,4)`
 - `reshape(m,2,6)`
 - `reshape(m,4,3)`
 - `reshape(m,4,[])`
- `fliplr(m)`
- `flipud(m)`
- `rot90(m)` *rotates counterclockwise*
 - `rot90(m,-1)`
 - `rot90(m,2)`

Replicating matrix

- `repmat(m, r, c)`
- `m=[1 2; 3 4];`
- `repmat(m,1,3)`
- `repmat(m,2,2)`
- `repmat(m,2,3)`

1	2
3	4

Exercise

- 1.32: Find an "efficient" way to generate the following matrix:

m =

7	8	9	10
12	10	8	6

- Increment the first row of the above matrix m with +1, and the second row of m with +2, in a single statement.
 - If matrix m had more than two rows, your code should add +3 to the third row, +4 to the fourth row, etc.

Empty vectors

- `e=[]`
 - `size(e)`
 - `numel(e)`
- Empty vectors can be used to delete elements from vectors/matrices
 - `m=randi(10,3,4)`
 - `m(:,4) = []`
 - `m(1,:) = []`
 - `m(2:4) = []`

Three dimensional matrices

- `m=zeros(3,4,2)`
- `m(:,:,1)=randi(100,3,4)`
- `m(:,:,2)=randi(100,3,4)`

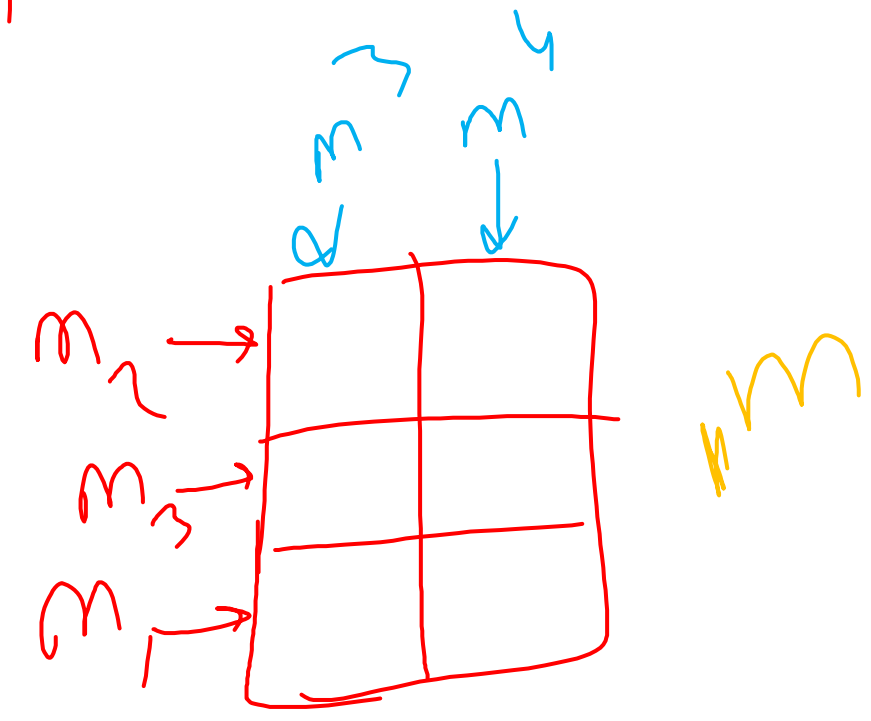

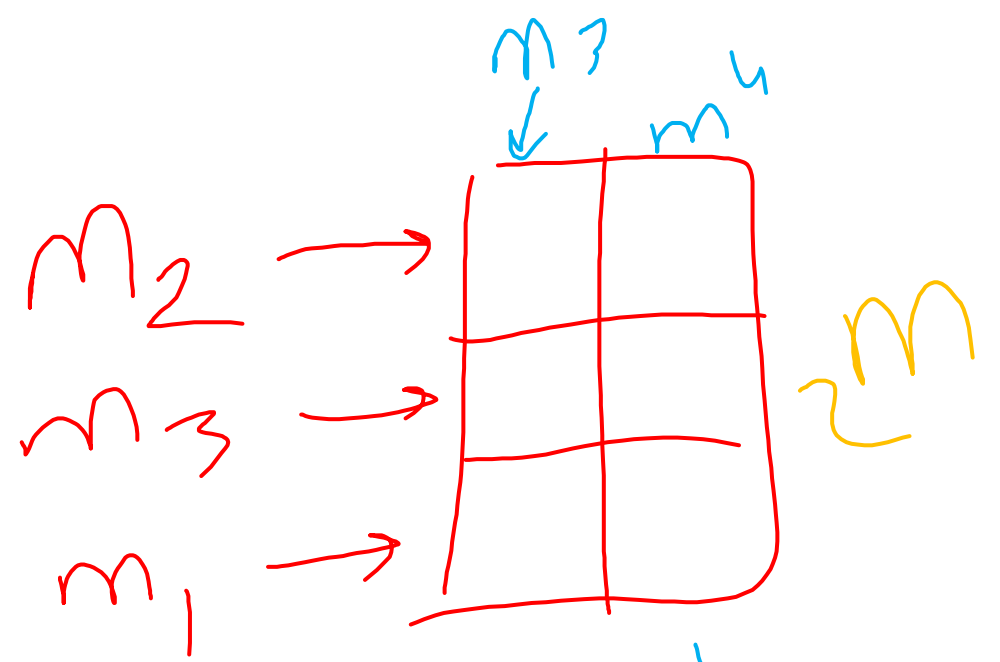

`m=randi(100,3,4,2)`

`m(:,:,1) =`

62	<u>13</u>	84	84
35	<u>74</u>	40	33
94	<u>65</u>	75	56

`m(:,:,2) =`

98	<u>62</u>	42	98
55	<u>37</u>	50	33
34	<u>76</u>	70	84

`m([2 3 1], [3 4], [2 1])`

Basic statistics functions

- **sum**(v), **sum**(A), **sum**(A,dim)
- **mean**(v), **mean**(A), **mean**(A,dim)
- **std**(v), **std**(A), **std**(A,0,dim)

- **diff**(v), **diff**(A), **diff**(A,[],dim), **diff**(A,k)
- **min**(v), **min**(A), **min**(A, [], dim), **min**(A,b), **min**(A,B)
- **max**(v), **max**(A), **max**(A, [], dim), **max**(A,b), **max**(A,B)

- [x,pos] = **min**(v)
- [x,pos] = **max**(v)

Plotting

- `plot(X,Y)`
- `plot(X,Y,'r*')`
- `scatter(X,Y)`

- `axis([xlow, xhigh, ylow, yhigh])`
- `xlabel('time (sec)')`
- `ylabel('temperature (Fahrenheit)')`
- `title('Temperature vs. time')`
- `legend`
- `grid on`
- `subplot(R,C, i)`
- `hold on/off`
- `clf`
- Saving plots as image files (File -> SaveAs).

plot([1 4 17 12], [10 3 15 7])

Exercise

- Draw four random triangles using the `plot()` function. Use a different color, marker, and line type for each triangle.

Bar-plot

- `bar(Y)`
- `bar(X, Y)`
- `errorbar(X, Y, E)`

Summary

- [...] creates vectors and matrices
 - comma or space adds entries on the same row
 - semicolon or linebreak introduces new row
- Linear Indexing: $v(\text{ind})$
 - ind can be a scalar to access an individual element
 - ind can be a vector to access multiple elements
 - If v is a matrix, we pretend it is a vector by considering column-by-column ordering of its elements
 - "end" keyword within ind replaced with number of elements of v .
- Row-Column Indexing: $m(r,c)$
 - r/c can be scalars, to access an individual element
 - r/c can be vectors, to access multiple elements
 - The result will have the same number of rows as r , and the same number of columns as c .
 - Values in r determine which rows of m are used to fill in each result row. Values in c determine which columns of m are used to fill in each result column.
 - end keyword within r replaced with number of rows of m .
 - end keyword within c replaced with number of columns of m .

Summary

- $v(\text{ind}) = x$; $m(r,c) = x$; When indexing is used as target of an assignment:
 - If multiple elements are indexed and there is a scalar x : x is copied into each indexed position.
 - If multiple elements are indexed and x is not a scalar: there needs to be the same number of elements in x and the number of positions being indexed.
- $v(\text{ind}) = []$ and $m(r,c) = []$ are used to remove the indexed entries from vector/matrix.
 - When a matrix is linearly indexed, the removal of elements would force it to become a vector.

Summary

- `rand`, `zeros`, `ones`, `inf`, `nan`, `true`, `false`, `randi`
 - Create a scalar, when no dimension arguments are given: `rand()`
 - Create a square matrix, when a single dimension argument is given: `rand(5)`
 - Create a matrix with any number of rows and columns, when two dimension arguments are given: `rand(3,4)`
 - `randi` has a reserved first input that must be provided before any dimension arguments are given.
- `sum`, `mean`, `std`, `min`, `max`, `diff`
 - When a vector input given (regardless of row vector or column vector), operate on the vector.
 - When a matrix is given, operate on each column separately.
 - If need to perform on each row, supply a dimension argument 2.
 - Some of these functions have a reserved second input argument, which must be specified before any dimension arguments are given.

Summary

- `reshape()` creates a matrix with different number of rows and columns, while preserving the linear order of elements
- `repmat(x, r, c)` uses `x` as a "brick" to build a wall that is `r` high and `c` wide.
